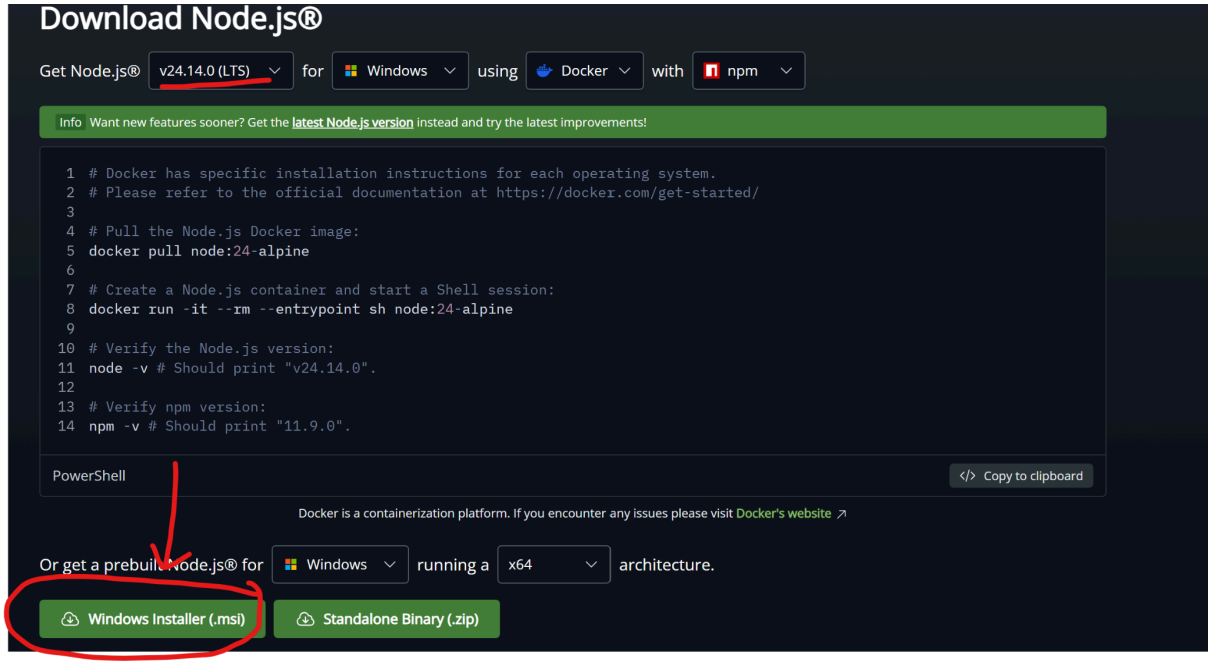
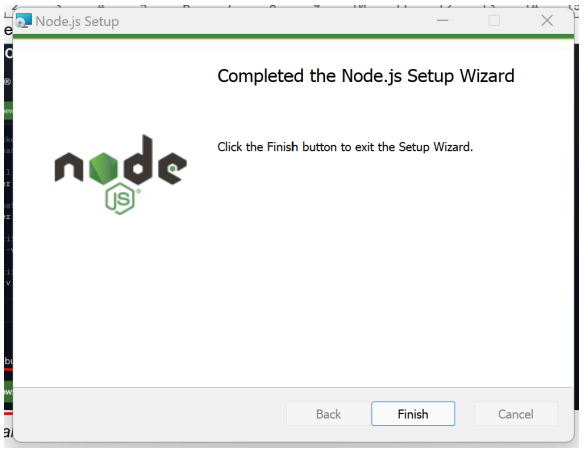
Install Node.js Guide

Step 1: Download the .msi installer from https://nodejs.org/en/download/current. Make sure you get the newest long-term support version (v24.14.0 as of Early 2026).

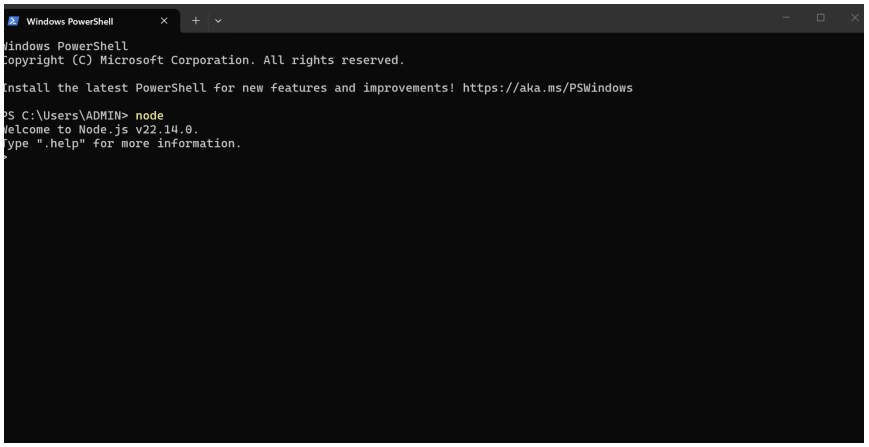


(You can also get the newest version but I'm not guaranteed it will work the same)

Step 2: Open the installer, follow its steps (mostly just clicking "Next", check the accept LA terms box), then click "Install" (you will need to grant the installer administrator privileges). Wait a few minutes for the set-up process to complete, then click "Finish".



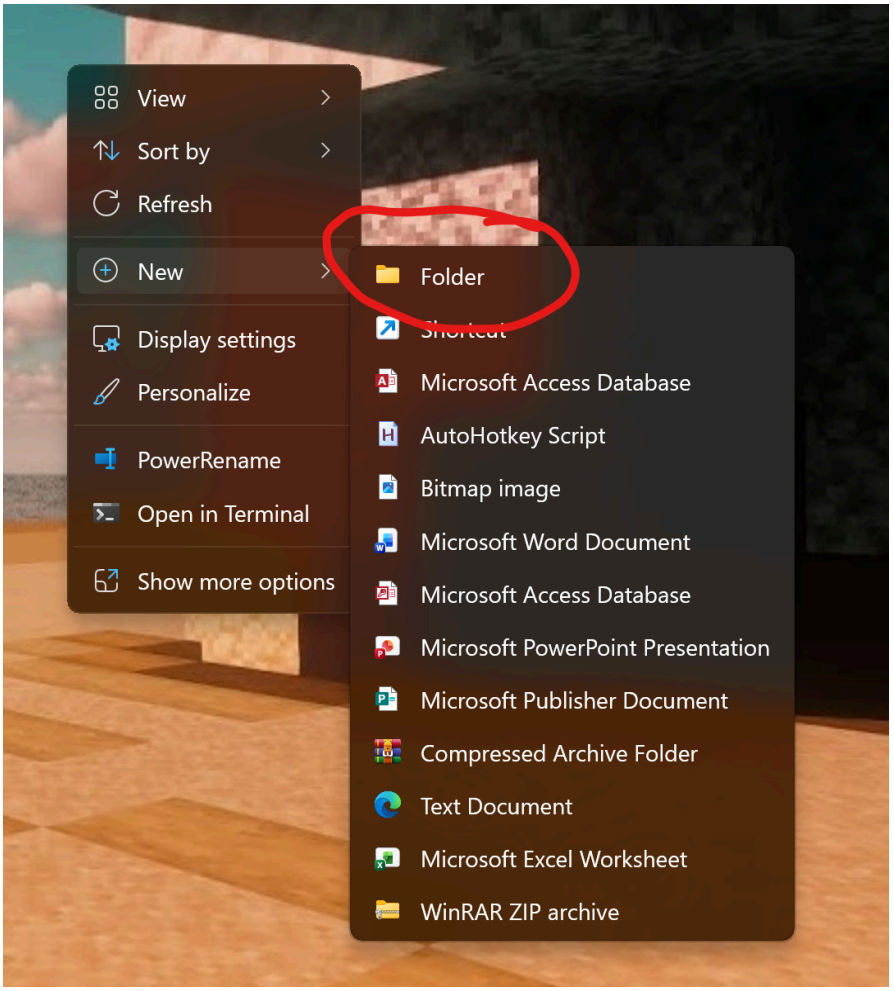
You can then check if you have successfully installed the correct version of Node inside the Terminal, by typing the command: *node*



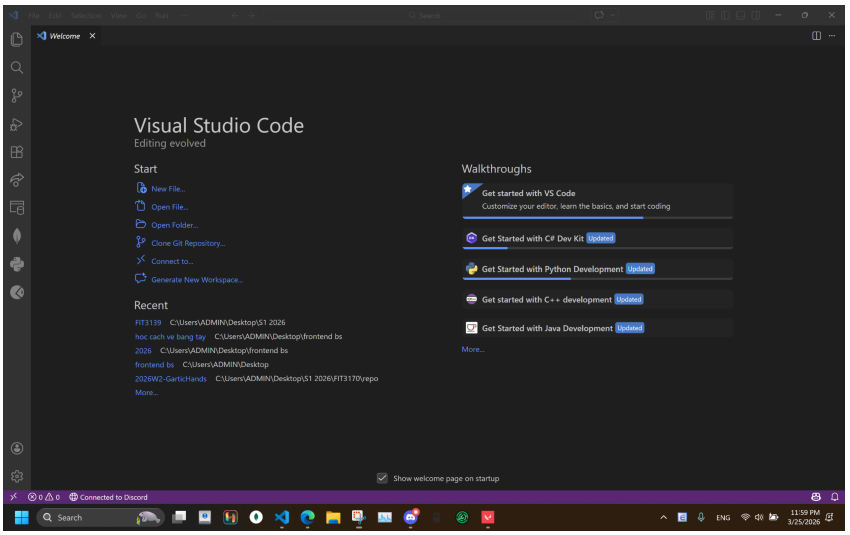
You can now install any dependencies in your repo using the command:
npm install [dependencies_name]

Cloning repo Guide (Visual Studio Code)

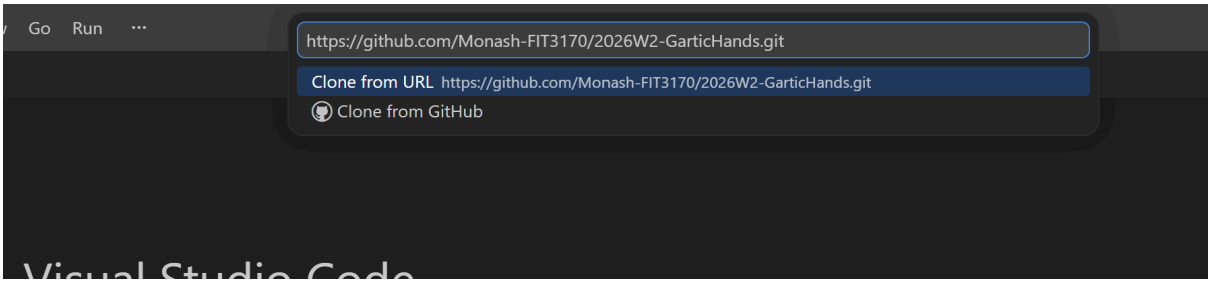
Step 1: Create an empty folder (You can do this in any of your existing folder, below is the image of me creating a new folder on the Desktop screen



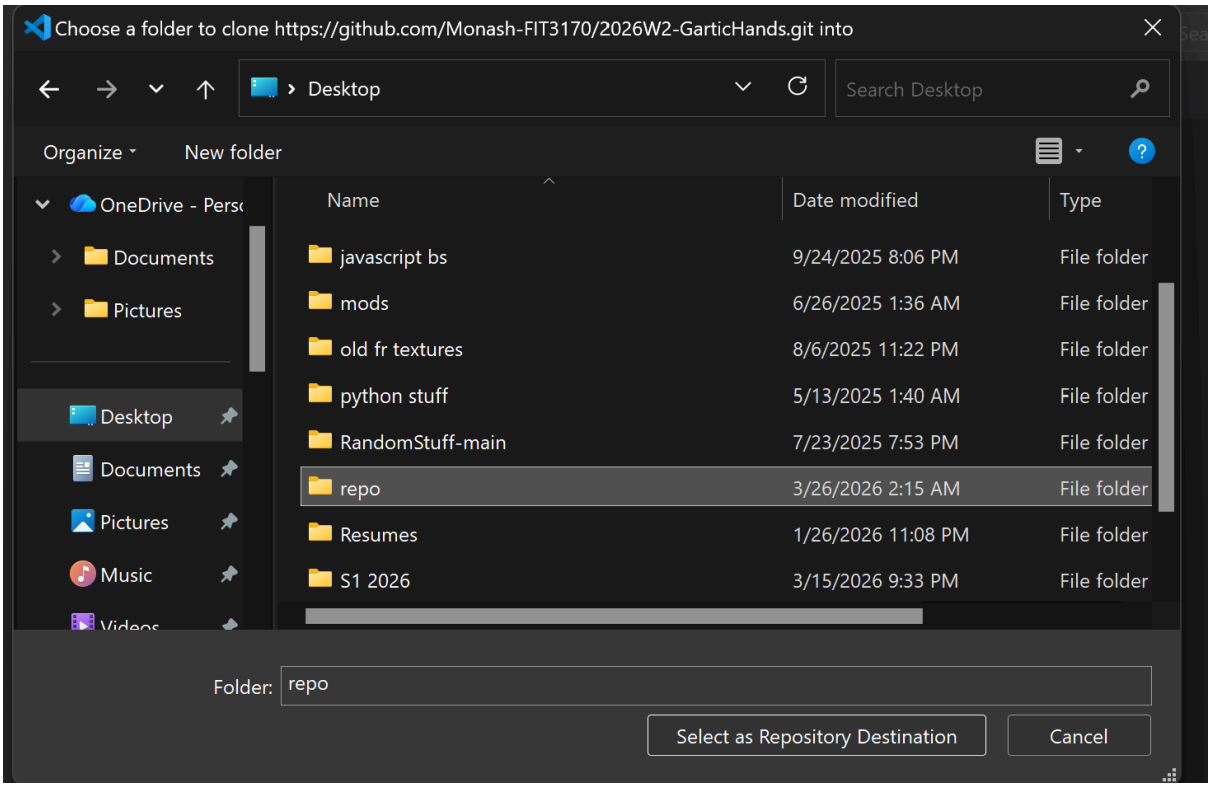
Step 2: Open Visual Studio Code, press Ctrl + Shift + N to open a new window



Step 3: Click “Clone Git Repository”, then paste in the team’s directory:
https://github.com/Monash-FIT3170/2026W2-GarticHands.git
Then press “Enter”, and choose the folder you just created.

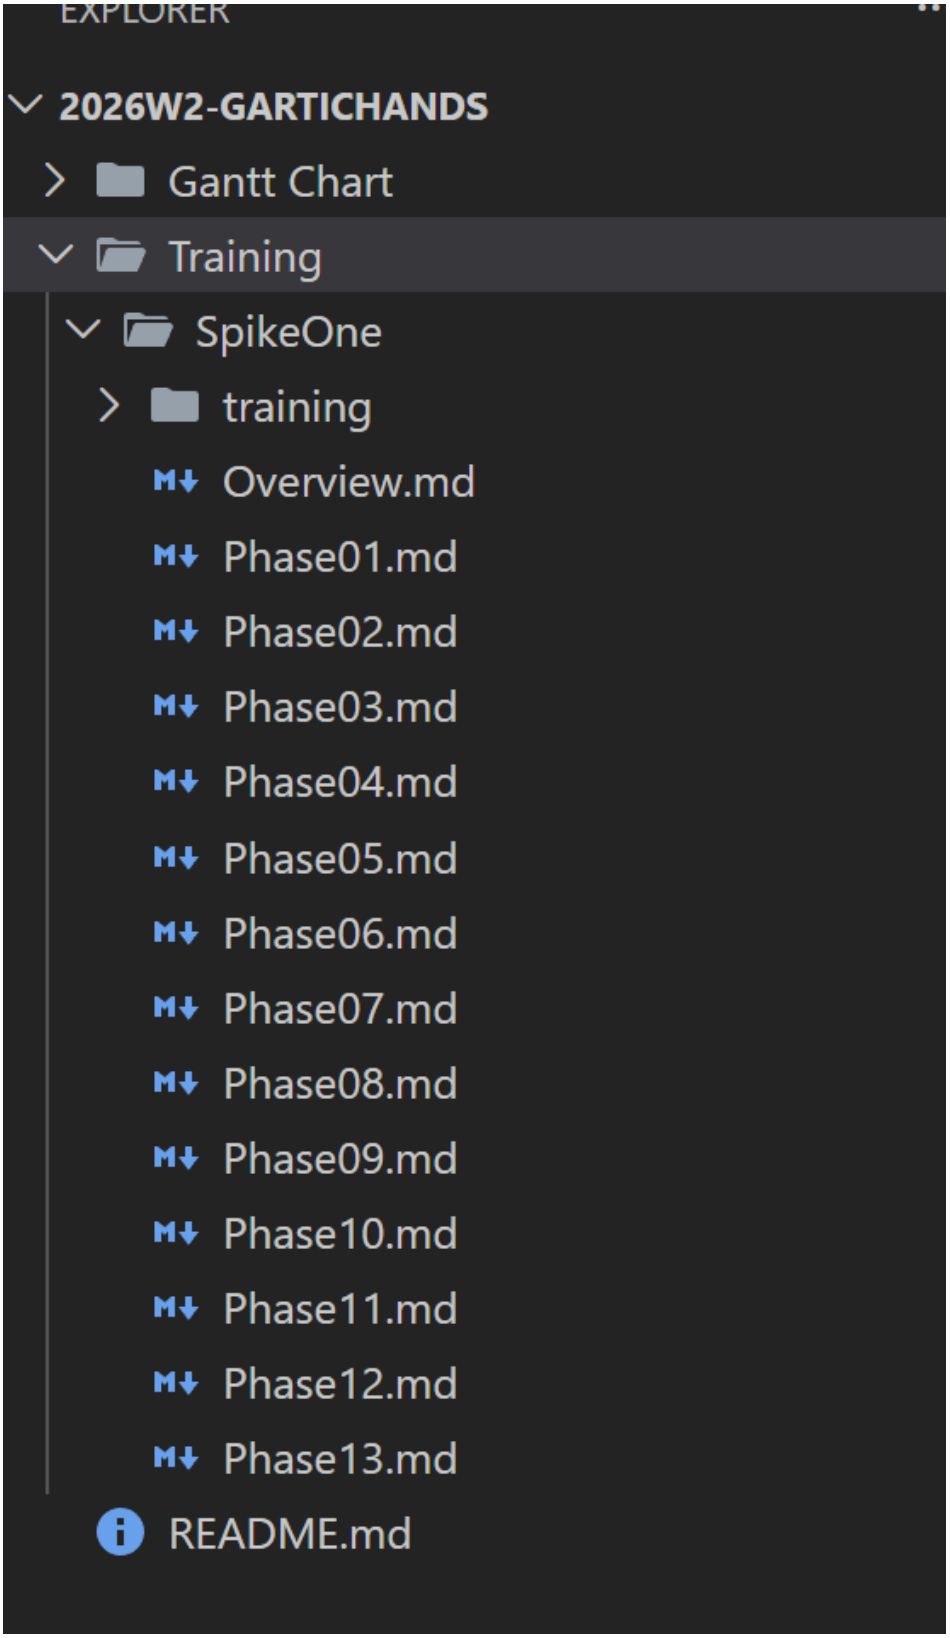


Then press “Enter”, and choose the folder you just created.



You can choose any folder, as long as it is an empty folder

You should now have a cloned version of the team's repo locally inside your VS code:



Feel free to mess around the cloned repo, as it will only change on your local machine until you commit and push.
